

Act instead of reacting

Optimized supply of your customers with SupplyOn Inventory Collaboration

Optimal production planning is possible only if you have reliable information about your customer's demand situation: when and in which quantities will which components be required for the manufacturing process. Improved production planning leads to cost reductions, less production bottlenecks and allows inventory to be minimized. Your customers are thus assured of the most reliable supply possible, which in turn has a positive impact on the business relationship.

With SupplyOn Inventory Collaboration you are always informed of the current consumption of components by your customer. You know your customer's actual stock level, gross demand and quantity of stock in transit. Stock levels can be visualized for any selected time-horizon. Thus you quickly see when a critical situation might develop. Moreover, you can simulate planned deliveries in order to see how the current stock level will change if the planned quantity is confirmed. If the defined minimum or maximum stock levels are exceeded, you receive an automatic E-mail notification. This allows you to flexibly react to swings in demand and avoid emergency shipments and delivery bottlenecks.

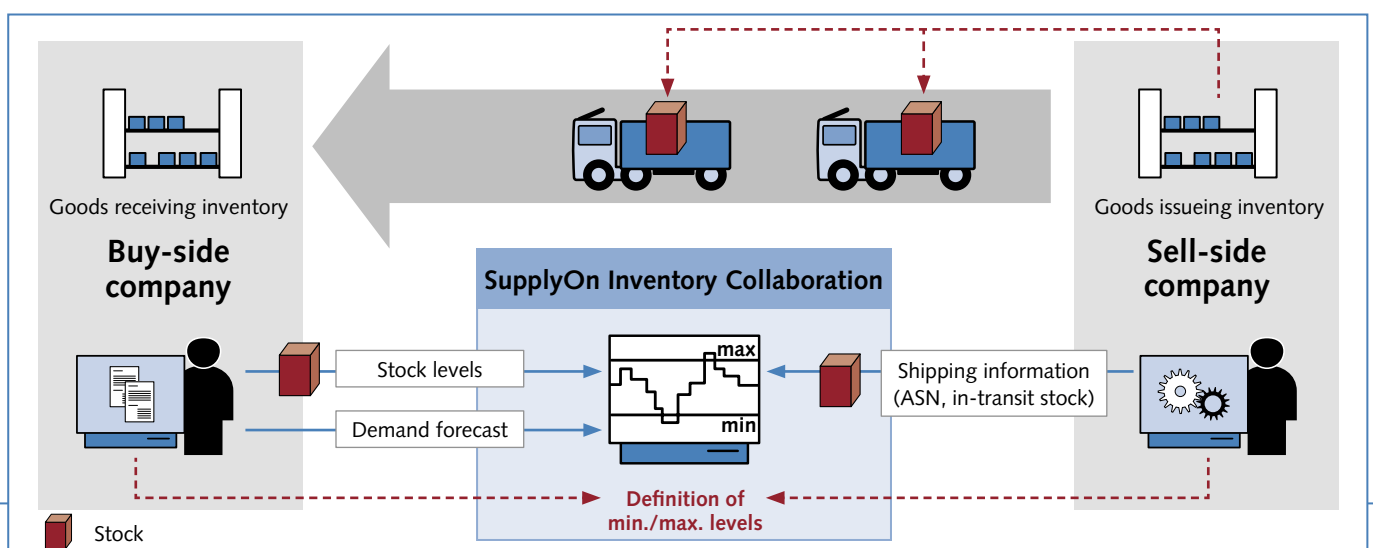

SupplyOn Inventory Collaboration results in transparency of the total supply chain stock, enabling the synchronized production of components and consumption-driven supply. Deliveries based only on delivery instructions belong to the

past. Guided by predetermined minimum and maximum stock levels, you decide for yourself when to deliver what quantities. Production scheduling does not have to be co-ordinated with your customer, permitting more flexible management of your production and the optimal utilization of manufacturing capacity. Stock, freight and administrative costs are reduced.

Improve your production from a cost, time and quality perspective by linking your processes more closely with those of your customer. Take over the dispatch function for your customer's inventory and benefit from reduced order management, production, inventory and shipping costs.

Your benefits at a glance

- You are able to optimally plan your production and improve capacity utilization.
- Current stock levels and future customer demand are transparent at all times.
- You receive a warning in advance of possible bottlenecks.
- Inventory, shipping and administrative costs are reduced.
- Supply bottlenecks, over-delivery, panic orders, extra shifts, production downtimes and expensive emergency shipments are avoided.
