

# SupplyOn Portal Integration

## The interface for employee and supplier portals to SupplyOn

SupplyOn provides a central portal infrastructure with features such as master data and user administration, navigation, user authentication and user authorization, in order to facilitate the efficient handling of various business processes with suppliers.

### Employee portals

Increasingly, our customers are implementing their own portals, for example in order to provide employees with uniform, roll-based access to in-house applications. These employee portals typically include certain central features that are also included in the SupplyOn portal infrastructure. At the very minimum, employee portals include a central user management.

In order that employees can access SupplyOn applications from the work environment to which they are accustomed, it makes sense to integrate SupplyOn's applications with the employee portal. It should also be possible to manage user data centrally.

SupplyOn's portal integration provides the solution: Employee's user data is extracted from the employee portal and transmitted to the SupplyOn portal infrastructure via the respective interfaces.

The administration of users is handled by the customer exclusively in its own employee portal. Based on their respective role, employees can access SupplyOn applications for which they have been authorized directly from the employee portal.

### Your benefits at a glance:

- The administration of users with regard to SupplyOn applications is automated. In particular, users are automatically deactivated with regard to SupplyOn applications.
- Single sign-on to SupplyOn applications from the employee portal.

### Supplier portals

Particularly in larger companies, supplier portals are often operated in parallel to employee portals in order to provide suppliers with a single access gateway to the respective company applications.

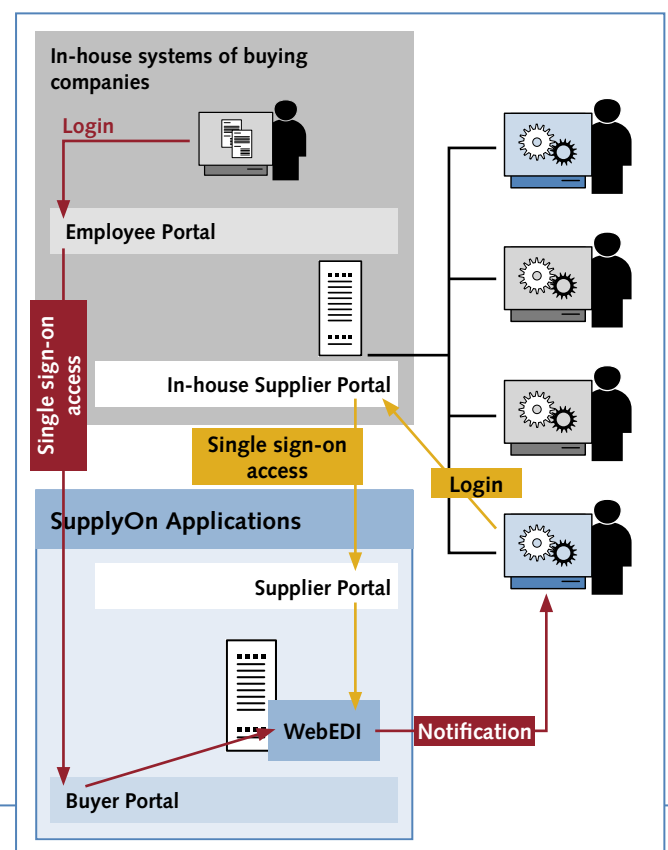

If a company decides that it would like to use SupplyOn's solution for specific supplier processes, however, this raises the questions how suppliers can access the SupplyOn solution

from the company's own supplier portal. To this end, SupplyOn offers a solution for integrating with companies' supplier portals which gives suppliers single sign-on access to the SupplyOn applications for which they have been registered via the customer's supplier portal without having to log on a second time.

Following initial registration with SupplyOn for the respective application, the supplier can "map" its supplier portal-user to the respective SupplyOn user the first times it accesses SupplyOn via the customer's supplier portal. From then on, the supplier has single sign-on access to SupplyOn's solutions via its customer's supplier portal.

### Your benefits at a glance:

- Simple mapping of users in the customer's supplier portal to the respective SupplyOn users.
- Single sign-on to SupplyOn applications from the supplier portal.

If you have any further questions about an **Integration with SupplyOn**, then please give us a call, or write to us. We would be pleased to provide you with more information.
